

An MFGx Product

FUUZ PACKAGING

Packaging Overview

Contact the sales team at sales@mfgx.io

Fuuz is offered in 3 distinct packages for a customer to select from, indicated below. In addition to the selected package, there may be additional add-ons required based on the scope of use for the Fuuz platform. Some of these add-ons may include pre-built solutions, or apps developed by MFGx or a certified partner of MFGx. There could be additional costs for apps depending on the vendor and any subsequent metering of certain transactions or usage, again, based upon the app and the vendors requirements.

Package Level Basics

Packaging Definitions

³ Global Site Support: Each subscription level provides support for a maximum number of locations per legal entity subscribing to the Fuuz platform. Each physical location requires a separate Tenant on the Fuuz Platform, Subscription Pricing, Add-Ons and Features are all Per Tenant. Some exceptions may apply, check with your salesperson.

⁴ Connectors: These rows represent the number of Fuuz Integration Connectors that come included with the base subscription cost for each package tier. A Connector is comprised of: A) URL or Endpoint B) UserId or Credential and C) Password or Token. This unique combination is what defines an Integration Connector. Machine and IIoT connectors are per device, or per IP address. Additional connectors are available for any package tier. Some connectors are pre-built to simplify the integration process with 3rd party solutions, as listed in the integrations tables; however, if not listed, you can use generic connectors to establish integrations with any external system you wish. Machine and IIoT connectors are metered at 4x/minute and 8x/minute respectively.

⁶ Build and QA Environments: These are crucial to leverage the citizen developer tools of the Fuuz Platform. Enabling you to develop / create apps, install and test new apps, train users and perform UAT, outside of your production environment.

⁷ Single Sign On (SSO): Single sign on eliminates the need to manage multiple user names and passwords. This applies to the Fuuz Platform only, and not any other services provided to customers such as the community and knowledge base which are 3rd party. Currently SSO is supported only for users of Office365 using AzureAD.

⁸ EDI Partners: An EDI partner is defined as a unique trading partner ID, not necessarily a single ship to destination, this could be the customer or supplier as a whole entity. You can add as many partners as necessary.

⁹ Gold Service Contract: This service level comes as an annual subscription for the duration of your Fuuz Platform subscription. This includes access to our online learning TrainerCentral site with several courses designed to educate the customer on how to leverage the citizen developer tools in Fuuz. This is unlimited user based.

¹⁰ Platinum Service Contract: This service level comes as an annual subscription for the duration of your Fuuz Platform subscription. This includes access to our online learning TrainerCentral site with several courses designed to educate the customer on how to leverage the citizen developer tools in Fuuz. Also included in this level of support is our dedicated support staff and professional services, with up to 40 hours per year included. This is unlimited user based.

¹¹ Diamond Service Contract: This service level comes as an annual subscription for the duration of your Fuuz Platform subscription. This includes access to our online learning TrainerCentral site with several courses designed to educate the customer on how to leverage the citizen developer tools in Fuuz. Also included in this level of support is our dedicated support staff and professional services, with up to 100 hours per year included. This is unlimited user based.

¹² GovCloud Deployment: Rarely necessary however should this be required due to the nature of your business, we can deploy your entire Fuuz solution on GovCloud, this does carry a significant additional cost.

¹⁴ Private Cloud: This deployment option generally reserved for large enterprise rollouts, provides the ability to deploy Fuuz on a separate private AWS cloud. This option adds a significant amount of cost, but provides larger companies with greater visibility to the services and performance of their Fuuz deployment.
